**tick ID**

**Know Them. Prevent Them.**

### Deer Tick (Black-Legged Tick)

- Deer ticks may transmit the agents that cause Lyme disease, anaplasmosis, and babesiosis
- **What bites:** nymphs and adult females
- **When:** anytime temperatures are above freezing, greatest risk is spring through fall

#### Actual Size

- Nymph: (1/32” – 1/16”)
- Adult: (1/8”)
- Engorged Adult: (up to 1/2”)

### Dog Tick

- Dog ticks do not transmit the agent that causes Lyme disease
- **What bites:** adult females
- **When:** April–August through fall

#### Actual Size

- Adult Male
- Adult Female

*(examples are not actual size, dog tick nymphs are rarely found on humans or their pets)*

### Prevent the Bite

- Wear light-colored protective clothing
- Use EPA-approved insect repellent on skin or clothing
- Use caution in tick infested areas
- Perform daily tick checks
- Protect your pets, use repellents, acaricides, and a Lyme disease vaccine for dogs

### Tick Removal

Remove ticks immediately. They usually need to attach for 24 hours to transmit Lyme disease. Consult a physician if you remove an engorged deer tick.

**Using a tick spoon:**

- Place the wide part of the notch on the skin near the tick (hold skin taut if necessary)
- Applying slight pressure downward on the skin, slide the remover forward so the small part of the notch is framing the tick
- Continuous sliding motion of the remover detaches the tick

**Using tweezers:**

- Grasp the tick close to the skin with tweezers
- Pull gently until the tick lets go
